FORAGE

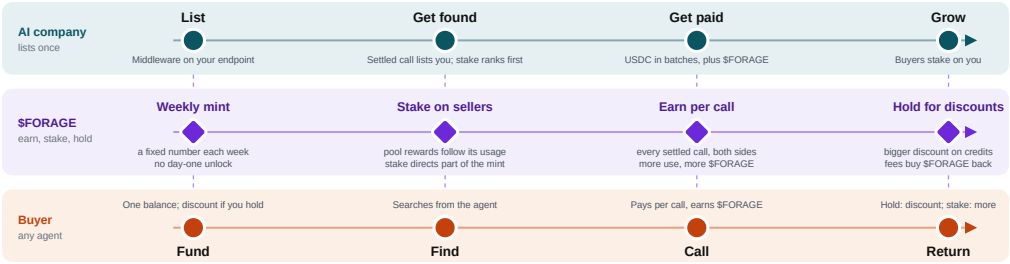

The open market for AI tools. Working name.

Every AI tool on one balance, paid per call. AI companies list once and keep what they earn, whoever brings the buyer gets paid, every settled call earns $FORAGE on both sides, and staking it on the suppliers you believe in earns more.

7 October 2026 · Atharva Amritkar. Payment on x402, identity on ERC-8004, settlement in USDC on Base; the call runs direct and never touches the chain. A fixed number of $FORAGE is minted each week and split by use; stake it on any supplier for a share of that pool; the more you hold, the bigger your discount on every AI company's credits.

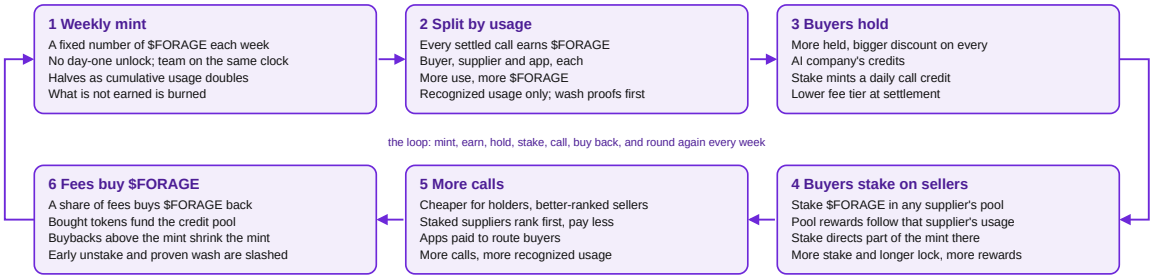

The flow, in one look

list once; every agent can find you, pay you and come back; $FORAGE runs between the lanes

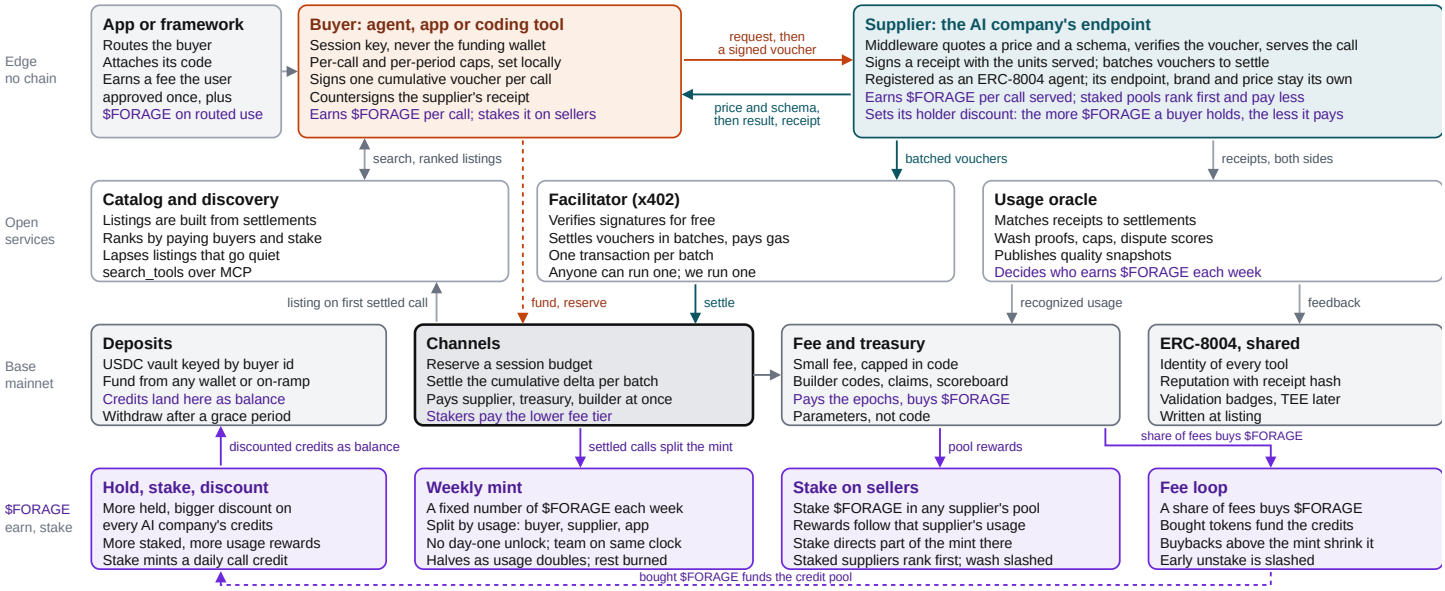

How $FORAGE works

the most important loop in the market: a fixed weekly mint, earned by use, held for discounts, staked on sellers, bought back from fees

How it all fits together

every component, what moves between them, and where $FORAGE is earned, staked and used

The call runs at the edge and never touches the chain; open services anyone can run do discovery, settlement and accounting; Base holds the money, the identities and the parameters; $FORAGE is minted weekly, split by use, held for discounts, staked on sellers and bought back from fees.

For AI companies

list once

- **Customers you never onboarded.** No signup, no card, no key.
- **Keep what you earn,** in USDC, to your wallet.
- **Your endpoint, your brand, your identity;** apps are paid to bring you buyers.
- **Earn $FORAGE on every call you serve.** Buyers stake on you, directing part of each week's mint to your pool and ranking you first; set a holder discount and the best-funded buyers come to you.

For buyers

one balance

- **Every tool, one balance.** Any wallet or on-ramp.
- **Nothing changes in your tools.** One MCP server.
- **No account anywhere;** pay per call, not per month, at prices the supplier's saved costs allow.
- **Earn $FORAGE on every call you pay for.** Hold it for a discount on every AI company's credits that grows with your holding; stake it on the sellers you like for more rewards.

For the apps that bring buyers

get paid

- **A builder code on every call** you route.
- **A fee the user approves once** and can revoke.
- **Claimed from the treasury,** no invoices; a public scoreboard of who brings paid volume.
- **Earn $FORAGE on the usage you route,** on top of the builder fee; stake it on sellers like anyone else.

How listing works

for the AI company

1. **Install middleware** — quotes price and schema
2. **Register identity** — an ERC-8004 agent
3. **Settled call lists you** — your first; no submissions
4. **Ranked by buyers** — paying buyers and stake
5. **Earn $FORAGE** — per call served, weekly
6. **Attract stake** — staked pools rank first

How a call works

for the buyer and its agent

1. **Fund** — balance; discount if you hold
2. **Cap** — session key, spend caps
3. **Find** — ranked; staked first
4. **Call** — voucher, receipt, $FORAGE
5. **Settle** — batched; fee tier if staked
6. **Stake** — on sellers you like, earn more

$FORAGE: a fixed number minted each week, split by recognized usage among buyers, suppliers and apps; no day-one unlock, the team on the same clock; the mint halves as usage doubles and the unearned part is burned; stake it on any supplier for a share of its pool; the more you hold, the bigger your discount on every AI company's credits. It opens in stages: prove the call, mainnet and apps, the weekly mint, then staking and credits. Working name; terms are proposals.
